

I already got vaccinated. I should be immune now. Do I have to still quarantine?

Yes, you need to still comply with the requirements of all applicable DPHSS Quarantine Guidelines. It is unknown whether vaccinated individuals might still be able to pass the virus on to others.

The vaccine will help protect you from getting ill or even from being hospitalized. However, it is possible that you could still carry the virus without knowing it, and you may still spread it to other people.

Individuals vaccinated must still continue to practice all COVID-19 precautions, including quarantine and testing.

I already got vaccinated. Will it affect my test to transfer to home quarantine?

The vaccines do not affect your test results. While you are in the GovGuam quarantine facility, you will still have to receive a Day 6 negative test result to transfer to quarantine at your personal residence.

I already got COVID-19 and I've recovered. I should be immune now. Why do I have to still quarantine?

Right now, we don't know how long or how well people are protected against getting COVID-19 again. We do know people can be reinfected. Because of this, people who have been previously infected must still practice all COVID-19 precautions, including being subject to quarantine.
